

Context Graph

VS

Knowledge Graph

One maps what is known.
The other assembles what matters now.

Swipe →

They answer different questions.

KNOWLEDGE GRAPH

**What exists - and
how is it
connected?**

ENTITIES
RELATIONSHIPS
FACTS

CONTEXT GRAPH

**What matters
now - for this
task, policy, and
time?**

INTENT
STATE
EVIDENCE +
CONSTRAINTS

'Context graph' is an emerging term. Here, it means the execution-time view an agent acts from.

Knowledge graphs make meaning durable.

Entities + relationships + typed facts

Good for integration, discovery, analytics, recommendations, and multi-hop reasoning.

An action depends on more than the domain map.

TIME

Which version is valid now?

PROVENANCE

Where did this belief come from?

STATE

What happened in this run?

AUTHORITY

Who may approve this action?

The same fact can be relevant, stale, forbidden - or too costly to include.

A context graph adds the situation around the facts.

Not a second graph database. A decision-ready view.

The difference is purpose - not storage technology.

LENS	KNOWLEDGE GRAPH	CONTEXT GRAPH
PRIMARY JOB	Represent durable meaning	Assemble situational relevance
TYPICAL UNIT	Entity-relation-entity fact	Contextualized fact, event, or trace
HORIZON	Long-lived domain memory	This task, turn, or run
EDGES EMPHASIZE	Semantic relationships	Temporal, causal, operational, policy
OUTPUT	Queryable subgraph	Budget-shaped context for a decision

Both can live in the same underlying graph and store.

ILLUSTRATIVE EXAMPLE

Should the agent pay this invoice?

THE KNOWLEDGE GRAPH KNOWS

- Acme is an approved vendor
- Invoice total is \$24,700
- Dev is the approver
- Approval limit is \$25,000

THE CONTEXT GRAPH ADDS

- Bank details changed yesterday
- A prior run flagged a mismatch
- Dev's credential is valid now
- The workflow is waiting on review

Same knowledge. Different action: hold and escalate.

Retrieval finds candidates. Context assembly makes the call.

MODEL-READY CONTEXT → ACTION → NEW EVIDENCE

Use both when the system can act.

SEARCH + DISCOVERY

A knowledge graph may be enough.

Catalogs

Enterprise search

Analytics

Recommendations

DECISIONS + ACTIONS

Add a context graph.

Agents

Workflow automation

Approvals

Triggers + tools

The higher the consequence, the more context must be explicit.

THE TAKEAWAY

**Store facts as a
knowledge graph.**

**Run agents on a
context graph.**

See the implementation. Run the demo.
